

CLAIMS

What is claimed is:

5 1. A method of reassigning resources in a soft programmable logic controller (PLC), the method comprising the steps of:

 selecting an interface in a first operating environment;

 selecting a virtual slot in a second operating environment for installation of the interface;

10 creating an installation file in the first operating environment for installation of the interface in the second operating environment; and

 installing the interface in the second operating environment using the installation file to reassign a resource between the first operating environment and the second operating environment.

15 2. The method of claim 1, wherein the first operating environment is essentially a non-real time operating environment and the second operating environment is essentially a real time operating environment.

20 3. The method of claim 1, wherein the second operating environment is essentially a non-real time operating environment and the first operating environment is essentially a real time operating environment.

4. The method of claim 1, wherein the first operating environment is an essentially non-deterministic operating environment wherein scan cycles are variable, and the second operating environment is an essentially deterministic operating environment wherein scan cycles are non-variable.

5 5. The method of claim 1, wherein the installing step includes installing a real-time device driver.

6. The method of claim 1, wherein the installing step overrides the installation of a device driver associated with the first operating environment mode.

10 7. The method of claim 1, during the creating step, installation parameters are obtained from the first operating environment and used in the creation of the installation file.

8. The method of claim 1, further comprising deleting the installation file.

9. The method of claim 1, further comprising uninstalling the resource from a device driver associated with the first operating environment.

15 10. The method of claim 1, further comprising enabling interrupt sharing for the reassigned resource so that an interrupt may be used for more than one resource.

11. The method of claim 1, further comprising the steps of:

displaying the resource for reassignment; and

selecting an empty interface slot in the second operating environment to receive the resource, the resource being one of an interface, a card, a device and a port.

5 12. The method of claim 1, further comprising modifying installation parameters to specify an installation file for a real-time driver.

13. The method of claim 1, further comprising updating a registry associated with the second operating environment to reflect a reassignment of the resource.

14. A method of automatically reassigning resources in a soft programmable logic controller,
10 the method comprising the steps of:

identifying a resource to be reassigned from a first processing mode to a second processing mode;

removing the resource from operation in the first processing mode;

creating an installation file containing information of at least one device driver;

15 assigning the resource for operation in the second operating mode by using installation parameters associated with the first operating mode; and

automatically installing the at least one device driver for the resource in the second processing mode using the information from the installation file so that any device in communication with the at least one device driver is functional.

15. The method of claim 14, wherein the removing step includes removing the resource from an essentially non-real time processing mode and the assigning step reassigns the card for operation in an essentially real-time operating mode.

16. The method of claim 14, further comprising updating a registry associated with the
5 second processing mode to reflect a reassignment of the resource.

17. The method of claim 14, wherein in the assigning step includes associating the assigned resource with a software component instance.

18. The method of claim 14, further comprising modifying installation parameters to specify the installation file.

10 19. The method of claim 14, further comprising displaying available resources for reassignment from the first processing mode to the second processing mode and selecting one of the displayed available resources for reassignment.

20. The method of claim 19, including building a list of available drivers for the selected resource.

15 21. The method of claim 14, in any step, the resource being one of a card, a port, an interface, and a device.

22. A system for reassigning resources in a soft programmable logic controller (PLC), the system comprising:

a means for selecting an interface in a first operating environment;

5 a means for selecting a virtual slot in a second operating environment for installation of the interface;

a means for creating an installation file in the first operating environment for installation of the interface in the second operating environment; and

10 a means for installing the interface in the second operating environment using the installation file to reassign a resource between the first operating environment and the second operating environment.

23. The system of claim 22, further comprising a means for reassigning the resource to a real-time operating environment.

24. The system of claim 22, further comprising a means for installing a real-time device driver.

15 25. The system of claim 24, wherein the means for installing a real-time device driver overrides an installation of a device driver associated with the first operating environment.

26. The system of claim 22, wherein installation parameters are obtained from the first operating environment and used in the creation of the installation file.

27. The system of claim 22, further comprising a means for deleting the installation file.

28. The system of claim 22, further comprising a means for uninstalling the resource from a
5 current device driver associated with the first operating environment.

29. The system of claim 22, further comprising a means for enabling interrupt sharing for the
resource so that more than one resource shares an interrupt.

30. The system of claim 22, further comprising a means for updating a registry associated
with the second operating environment to reflect a reassignment of the resource.

10 31. The method of claim 22, wherein the resource includes one of a port, an interface, a
device, and a card.

32. A computer program product comprising a computer usable medium having readable program code embodied in the medium, the computer program product includes:

a first software component to select an interface in a first operating environment;

5 a second software component to select a virtual slot in a second operating environment for installation of the interface;

a third software component to create an installation file in the first operating environment for installation of the interface in the second operating environment; and

10 a fourth software component to install the interface in the second operating environment using the installation file to reassign a resource between the first operating environment and the second operating environment.
